Solutions & Technical Manual

SOBEN INTERNATIONAL

High Performance Building Boards & Solutions for Sustainable Construction

Building With Confidence

A new benchmark for eco-friendly autoclaved cellulose fibre reinforced silicate matrix boards

Few versatile performance building boards offer both architectural envelope and strong technical specification as credible as the Soben International premium product range of eco-friendly autoclaved cellulose fibre reinforced silicate matrix boards. The line includes: fire protection calcium silicate boards, weather resistant fibre-cement boards and prefabricated panels. Since its establishment, Soben International has been a pre-eminent developer and manufacturer of high quality eco-friendly silicate matrix board solutions and has set a new benchmark for comparable products made in Asia.

With extensive product research and testing, our areas of expertise are sophisticated building solutions that tackle fire protection, multi-purpose constructions, façades and claddings where aesthetic finish and quality are of paramount importance.

Soben International high performance boards have been fully tested and certified by first class accredited laboratories and third party certification bodies to testify our commitment to performance, delivery of quality, and health and safety.

STRIVING FOR QUALITY PRODUCTS & PROFESSIONAL EXCELLENCE

FIRE-SAFE

Soben International Boards are prime protectants against fire damage. The range's high levels of fire resistance has been thoroughly tested and certified by official European laboratories.

RELIABILITY

The Soben International team is dedicated to retaining an excellent Client Services department to ensure your needs are adhered to quickly and effectively.

Quality Control and Quality Assurance programmes are in place in all Soben International divisions to guarantee that all orders of our fully tested products and solutions follow their ISO 9001, 14001 and CE Mark standards.

Soben International's customer service team is tasked with the primary goal of providing punctual delivery of shipments and endeavour to ensure that upon receipt of goods, each client's requisition is accurate and truthful to the product description.

ETHICAL

Soben International places great onus on the preservation of good practice and professional conduct at all stages of the supply chain. This is upheld from the manufacturing process to the delivery of goods and throughout all communication with stakeholders and clientele.

ECO-FRIENDLY

Standing at the forefront of environmental innovation, Soben International is committed to sustaining and developing a commendable CSR record. Our solutions for eco building and sustainable development projects have all been certified by the appropriate Green Label authorities.

DISCLAIMER

Please ensure that you have the latest version of this publication by checking that the publication date corresponds with the downloadable version from our website www.sobenboard.com. In case of doubt, please contact your local Soben International representative.

All information contained in this brochure is, to the best of our knowledge, correct at the time of printing. Soben International shall be under no liability whatsoever any loss or damages which may arise as a result of the failure to adhere to such recommendations in all aspects. Nothings in these Conditions, nor any compendiums, brochures, instructions, method statements or other documents or designs issued by or on behalf of Soben International shall create or to be deemed to create any obligation.

Soben International has a policy of continuous improvement and reserves the right to change specifications, designs of products and systems at any time without prior notice. Local authority must be consulted for compliance with local building regulations.

REGISTERED TRADE MARK

FP®-900 is a registered trade name for the product marketed in Europe.

FirePro® is a registered trade name for the product marketed in Asia.

FP®-900/FIREPRO® STRUCTURAL STEEL FIRE PROTECTION SYSTEMS

Fire protection of structural steel ensures structural adequacy of a loaded steel member or structure when it is exposed to fire. Steel in high temperature would lose its strength. Reduction of steel strength accelerates fast in elevated fire temperature beyond 400 °C. Default critical temperatures for steel columns and beams are 550 °C and 620 °C respectively in accordance with BS 5950: Part 8: Code of Practice for Fire Resistance Design. The steel strength retention is about 50% when the steel is heated up to the temperature at 550 °C. According to the cellulosic fire curve ISO 834 for a standard fire test of building elements, fire generates heat to reach the critical temperature of steel just a few minutes. Continuing high temperature would cause a failure of loadbearing capacity of an unprotected steel.

Strength retention factors for steel grades S275 to S355 of BS EN 10025 and BS EN 10210-1

Fire time-temperature curve, Cellulosic ISO 834

| FP®-900/FirePro® fire protection of Steel Beam testing according to EN 13381-4.

FP®-900/FirePro® provides fire protection of structural steel up to 240 minutes fire resistance rating. A series of FP®-900/FirePro® structural steel fire protection systems have been tested and developed to comply with a few countries' national fire standards, of which include BS 476: Part 21, EN 13381-4 and AS 1530.4. This technical manual focuses on FP®-900/FirePro® box protection systems in terms of BS 476: Part 21 and the current requirements in the UK for fire protection of structural steel stipulated in the 5th Edition of ASFP's Yellow Book. The Yellow Book had extensively elaborated the criteria of fire testing and extension of field applications of the steel protection systems both in British and European Standards. For further technical information of FP®-900/FirePro® structural steel protection systems in European or Australian Standard, please contact Soben International.

Similarly, the standard BS 476: Part 23: "Methods for determination of components to the fire resistance of a structure" defined the use of suspended ceilings for fire protection of structural floors with steel beam supports. For further information please read in conjunction with the Technical Manual for FP®-900/FirePro® ceilings and floors.

CONSIDERATIONS FOR FP®-900/FIREPRO® FIRE PROTECTION OF STRUCTURAL STEEL

Structural Steel	Fire protection is applicable to steel sections including structural steel beams, columns among other steel sections.									
Applications	FP®-900/FirePro® fire protection systems provide one to four sided fire protection of structural steel from 30 minutes to 240 minutes as well as various design temperature levels ranging from 350 °C to 750 °C.									
Fire Resistance	The protected structural steel elements are required to comply with a fire resistance performance in terms of BS 476: Part 2 I and the principle of 5 th edition of ASFP Yellow Book - Fire Protection for Structural Steel in Buildings.									
Board Thickness	The required FP®-900/FirePro® board thickness for a protected steel member is subject to the fire rating required and Am/V section factor of the steel.									
Steel Fastener	Size of self-tapping screws for fastening FP®-900/FirePro® boards to light gauge steel sections should have at least M3.5 at nominal 200mm centres. The steel screws should be zinc coated for rust resistance. Stainless steel fasteners are recommended at severe humid areas.									
Shot Fired Fastener	Shot fired fastening had been incorporated in FP®-900/FirePro® structural steel fire protection system testing. The light gauge steel sections are attached to the protected steel or supporting constructions with shot fired nails Ø 3.7 x minimum 16mm long at nominal 350mm centres.									
Steel Anchors	All-steel anchors are M6 expansion type. The minimum depth of engagement of the anchor into supporting constructions of concrete or masonry structures with respective to the fire ratings as follows.									
	<table border="1"> <thead> <tr> <th>Fire rating – minutes</th> <th>mm</th> <th>Minimum depth of anchor - mm</th> </tr> </thead> <tbody> <tr> <td>30 ~ 120</td> <td></td> <td>30mm</td> </tr> <tr> <td>180 ~ 240</td> <td></td> <td>40mm</td> </tr> </tbody> </table>	Fire rating – minutes	mm	Minimum depth of anchor - mm	30 ~ 120		30mm	180 ~ 240		40mm
Fire rating – minutes	mm	Minimum depth of anchor - mm								
30 ~ 120		30mm								
180 ~ 240		40mm								
Fire Rated Sealant	Where FP®-900/FirePro® fire protection boards abutting perimeter wall or floor constructions should be jointed tightly. In case of the construction surface is uneven, fire rated sealant should be applied to seal up any gaps at the joints. The sealant should be tested in accordance with BS 476: Part 20 or equivalent approval.									

TYPES OF ALL-STEEL EXPANSION ANCHOR

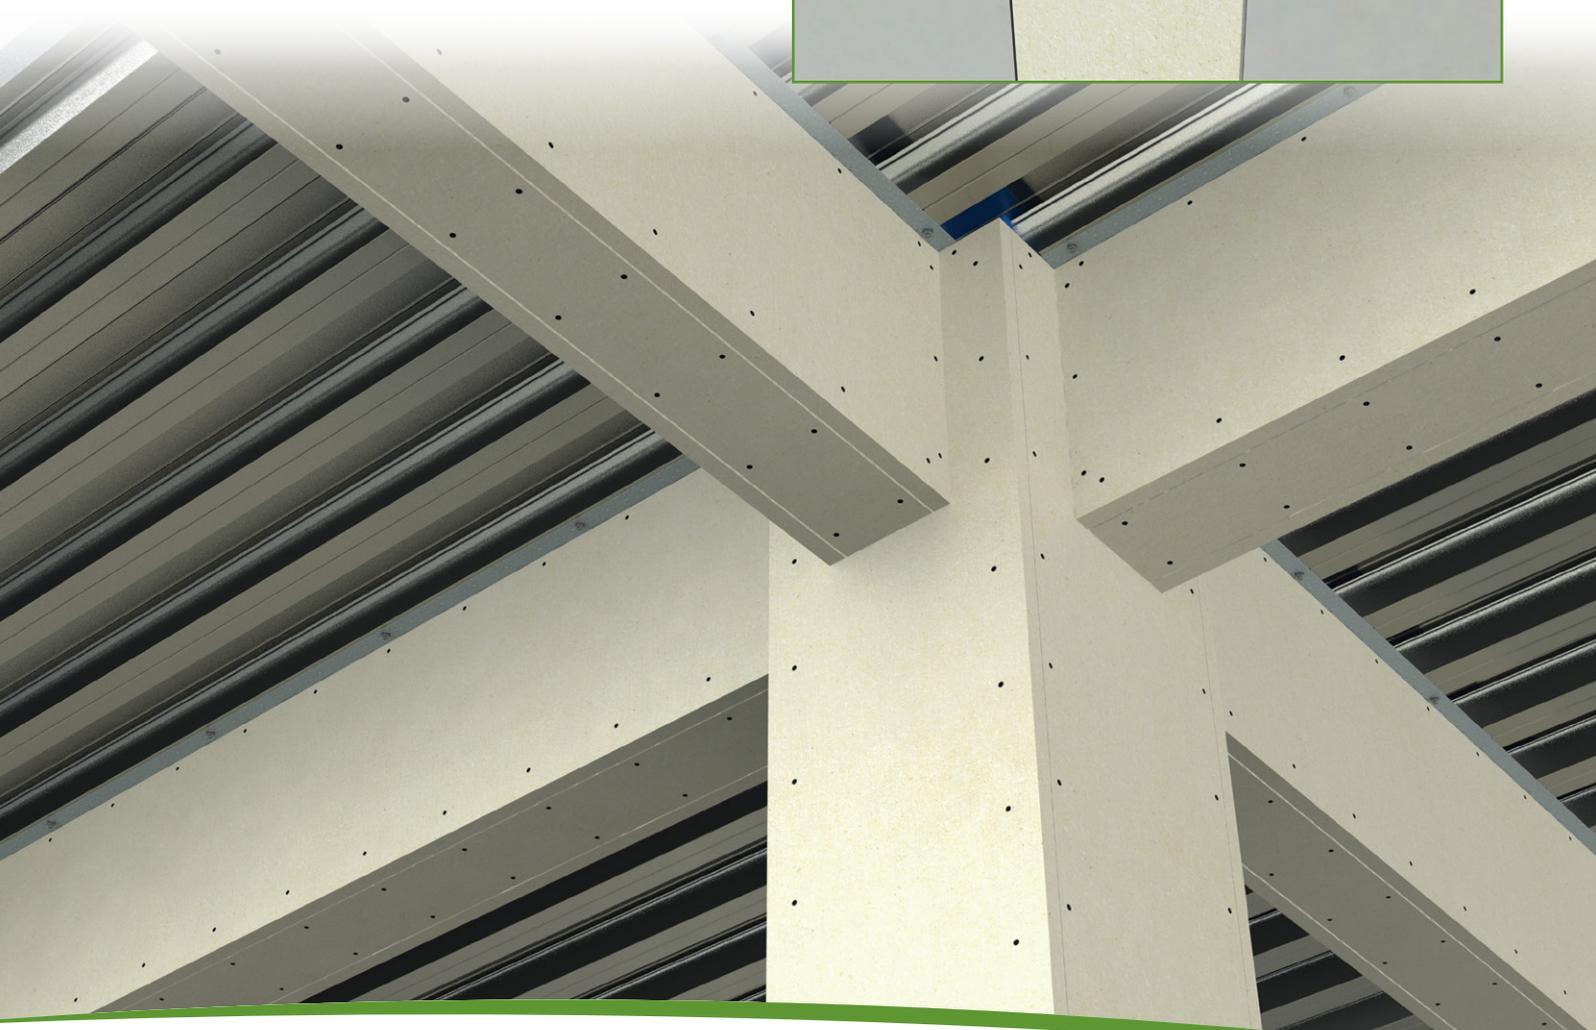

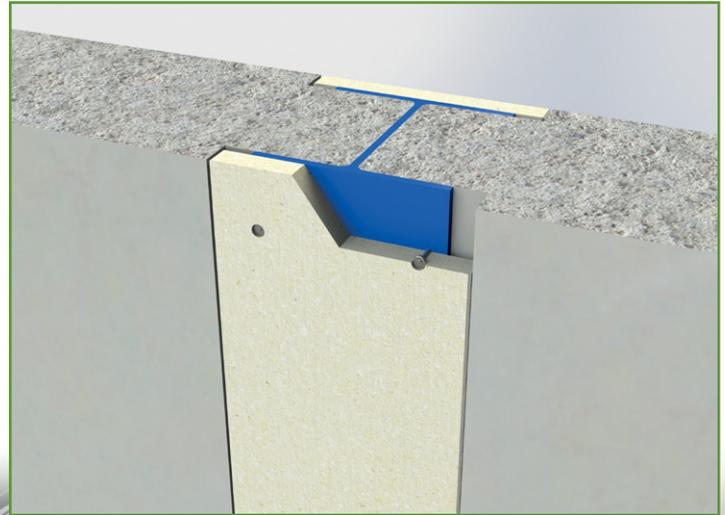

FP®-900/FirePro® Fire Protection of Structural Steel STEEL ENCASEMENT

FIRE RATING

FRL	Up to 240 minutes
Standard	BS 476: Part 21
Approval	FIRES-FR-167-17-AUNE
	FIRES-FR-184-18-AUNE
	FIRES-AR-007-NUPE3
	FIRES-2019-004
	Warringtonfire WF 413009

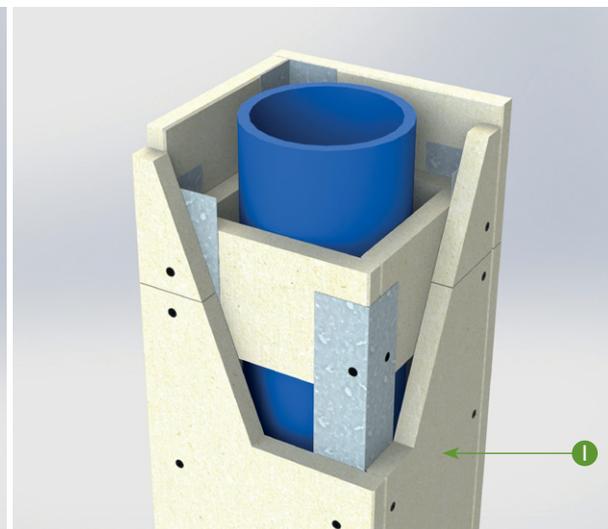

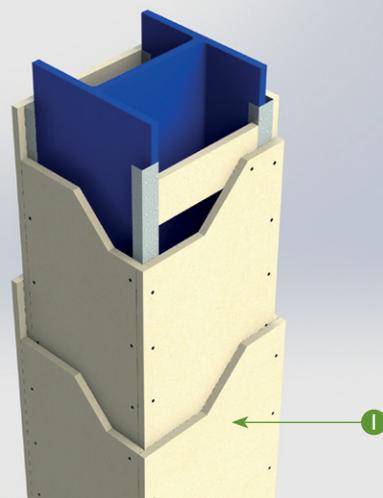

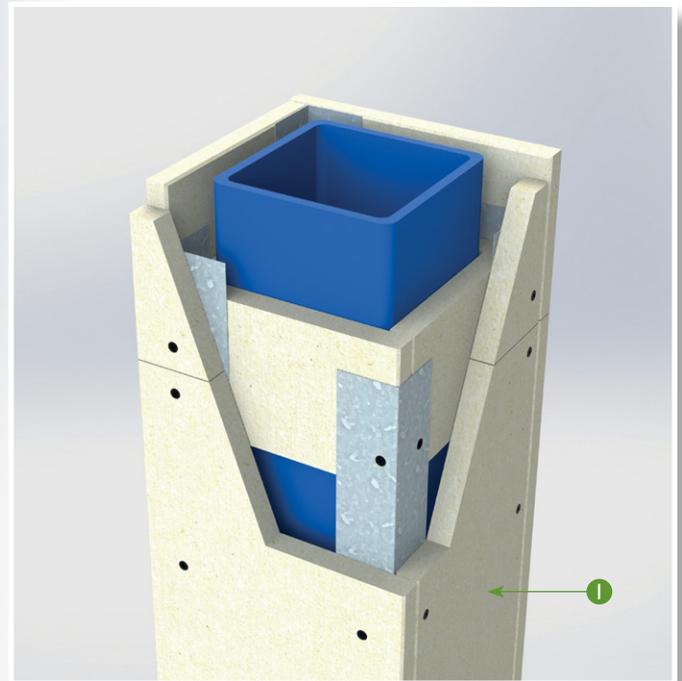

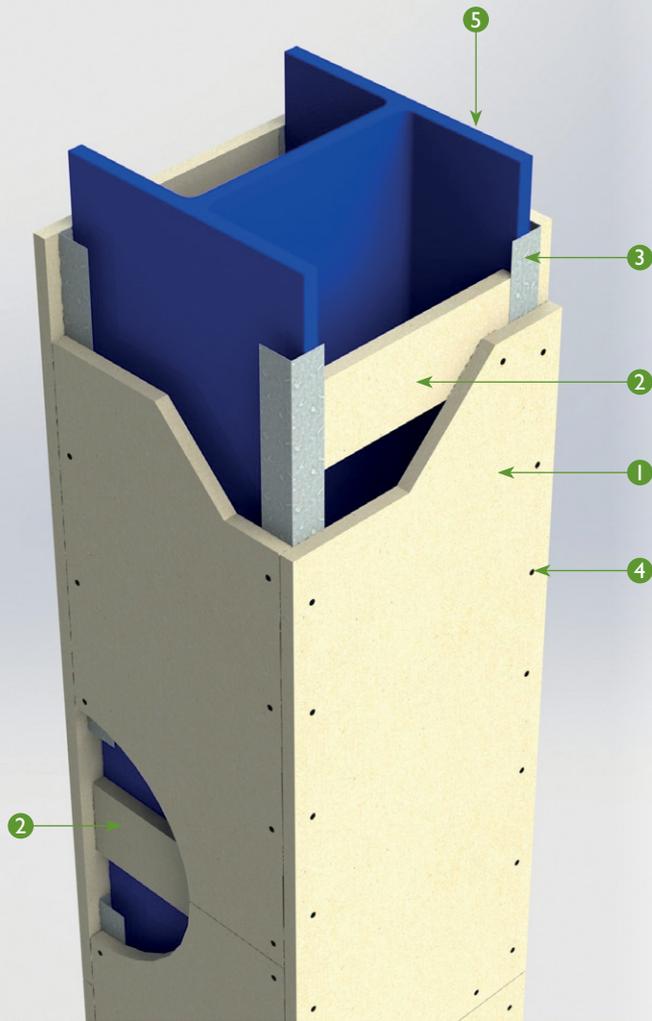

FP®-900/FIREPRO® STEEL ENCASEMENT

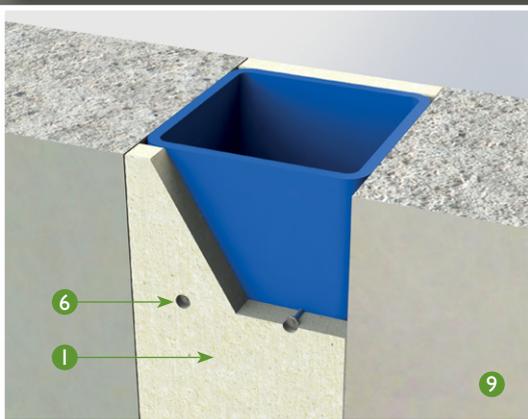

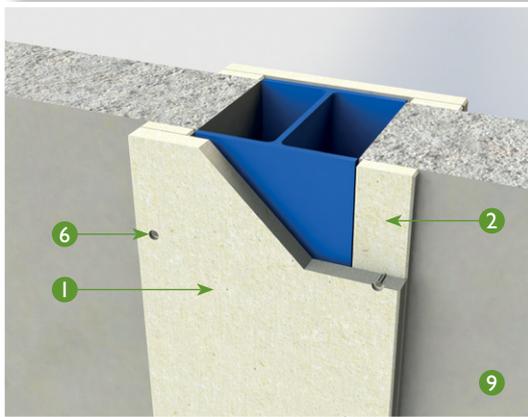

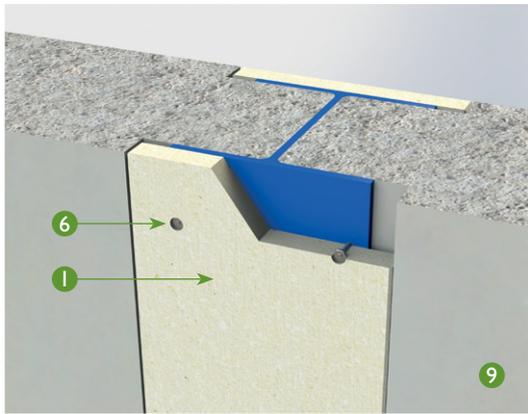

FP®-900/FirePro® fire protection steel systems may consist single layer or two-layer of FP®-900/FirePro® board for steel encasement subject to the A/V section factor and fire rating required for a steel section. Auxiliary light gauge steel profiles for board fixing ensure that the protective boards are firmly attached to the steel section of which may be severely deflected in the fire. Nonetheless, the auxiliary steel profiles do not apply on, either the boards directly fixed onto the supporting construction or small sections with steel flange width less than 100mm which edge fixing is adopted..

FIRE PROTECTION OF STEEL COLUMNS

FOUR SIDED FIRE PROTECTION OF COLUMNS

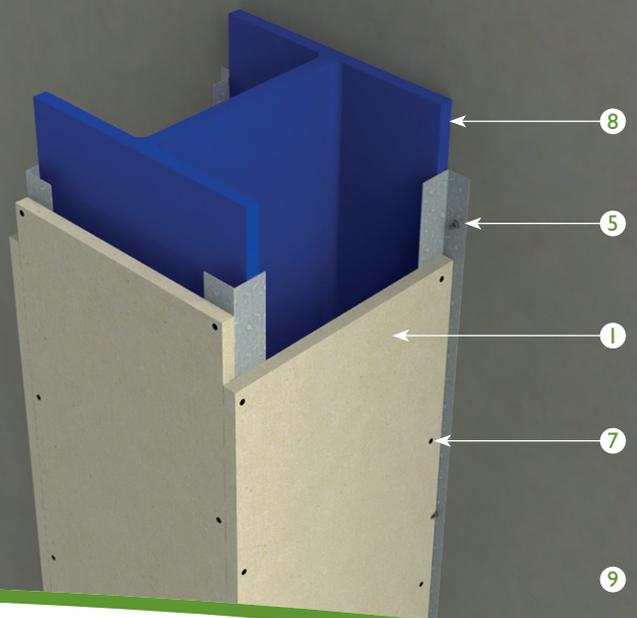

1. FP®-900/FirePro® board in single or two-layer
2. FP®-900/FirePro® backing strip 100mm wide at board joints
3. Light gauge steel profile
 - U-channel 50mm web x 32mm flange x 0.5mm thick, or
 - Angle minimum 30mm x 30mm x 0.5mm thick
4. Self-tapping screws minimum M3.5 x 35mm at nominal 200mm centres
5. Steel column

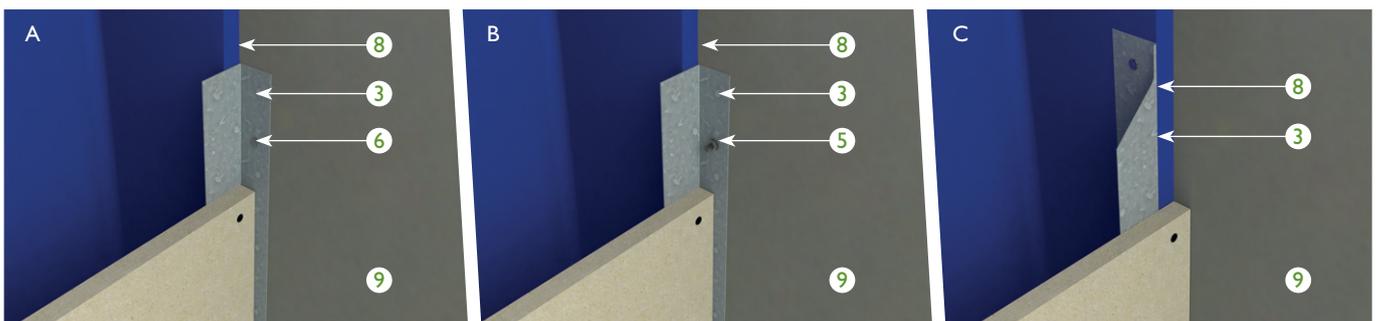

ONE TO THREE SIDED FIRE PROTECTION OF COLUMNS

1. FP®-900/FirePro® board in single or two-layer
2. FP®-900/FirePro® strip minimum 50mm wide
3. Light gauge steel profile
 - U-channel 50mm web x 32mm flange x 0.5mm thick, or
 - Angle minimum 40mm x 40mm x 0.5mm thick
4. Angle minimum 40mm x 40mm x 0.5mm thick fixed onto the wall or steel column
5. M6 screw anchors at nominal 500mm centres or
6. Shot fired nails minimum Ø 3.7 at nominal 350mm centres.
7. Self-tapping screws minimum M3.5 x 35mm at nominal 200mm centres
8. Steel column
9. Masonry wall / fire rated wall

Alternative fixing to the supporting construction

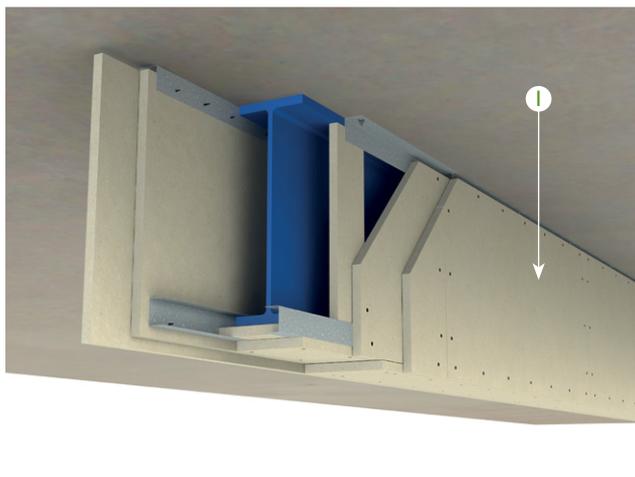

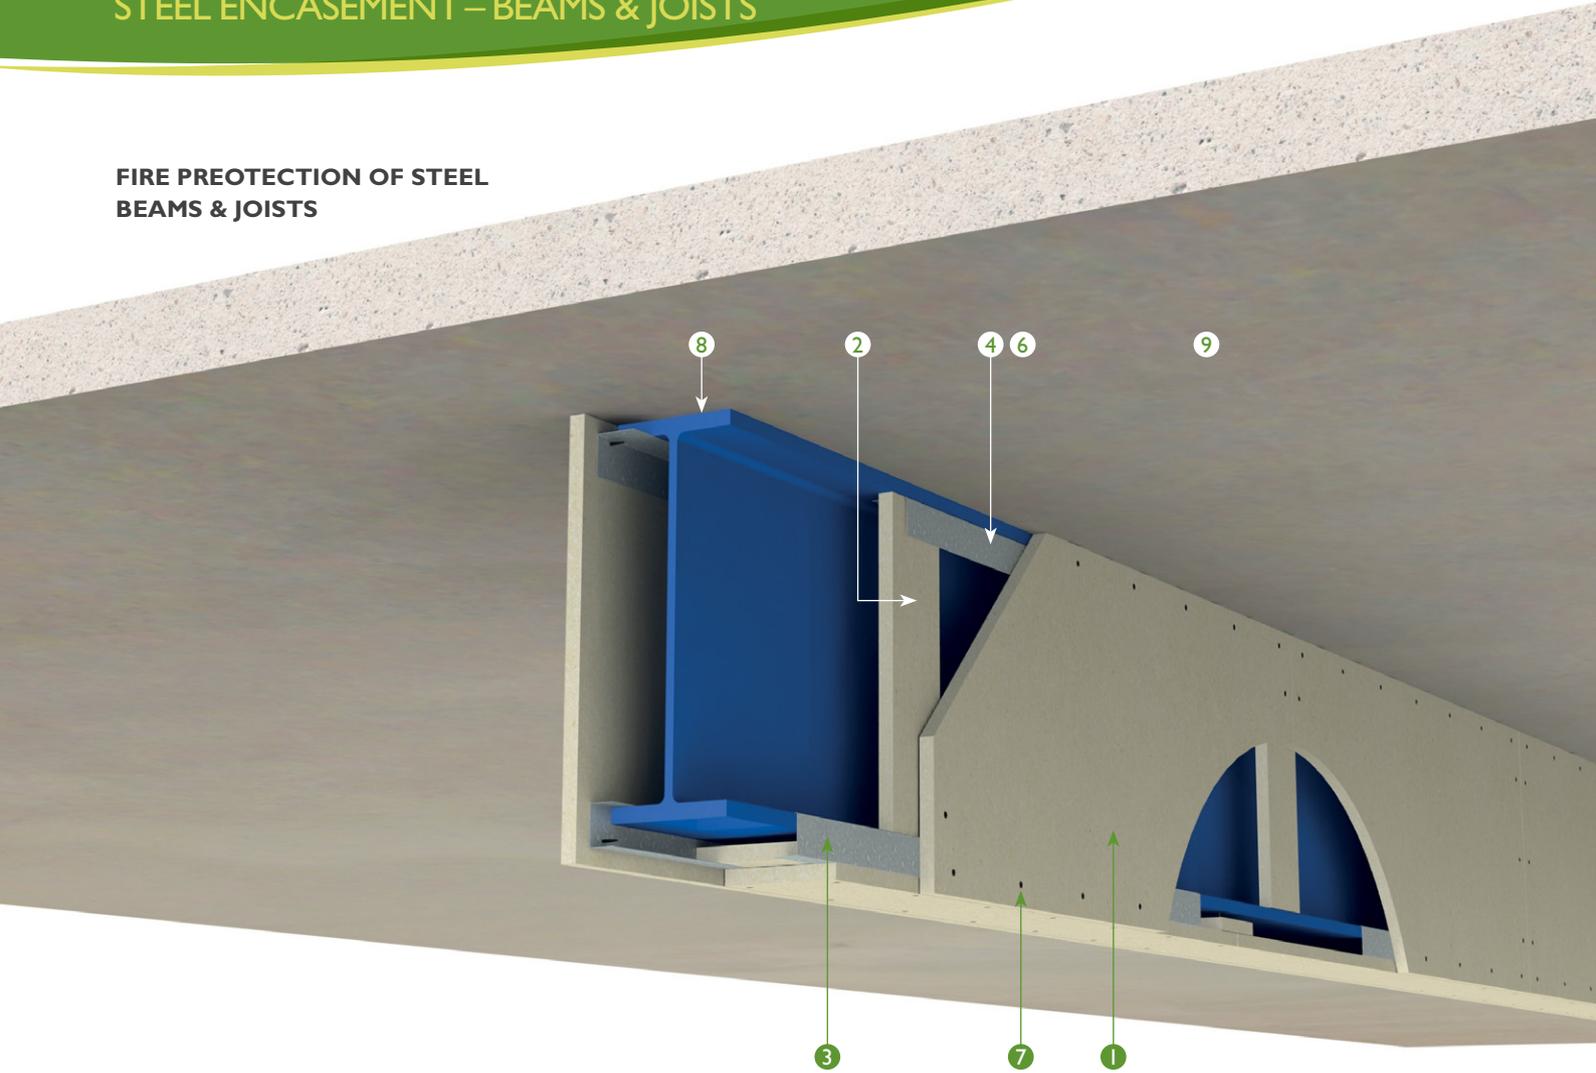

FP®-900/FirePro®

Fire Protection of Structural Steel

STEEL ENCASEMENT – BEAMS & JOISTS

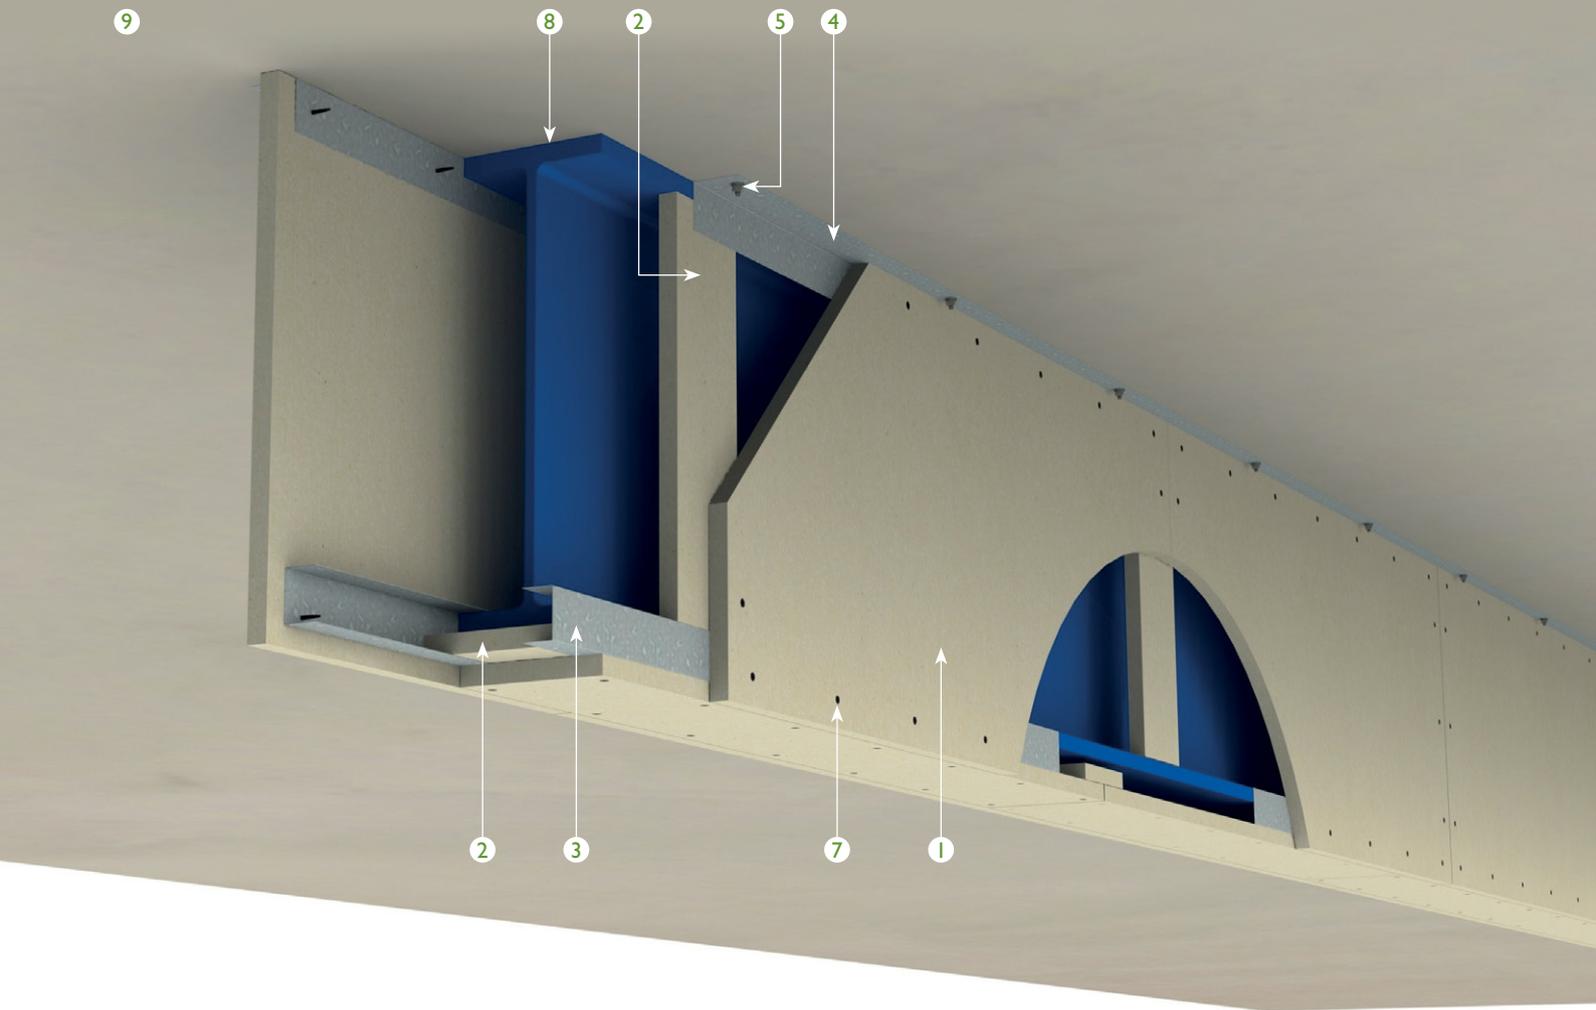

FIRE PROTECTION OF STEEL BEAMS & JOISTS

ONE TO THREE SIDED FIRE PROTECTION OF BEAMS

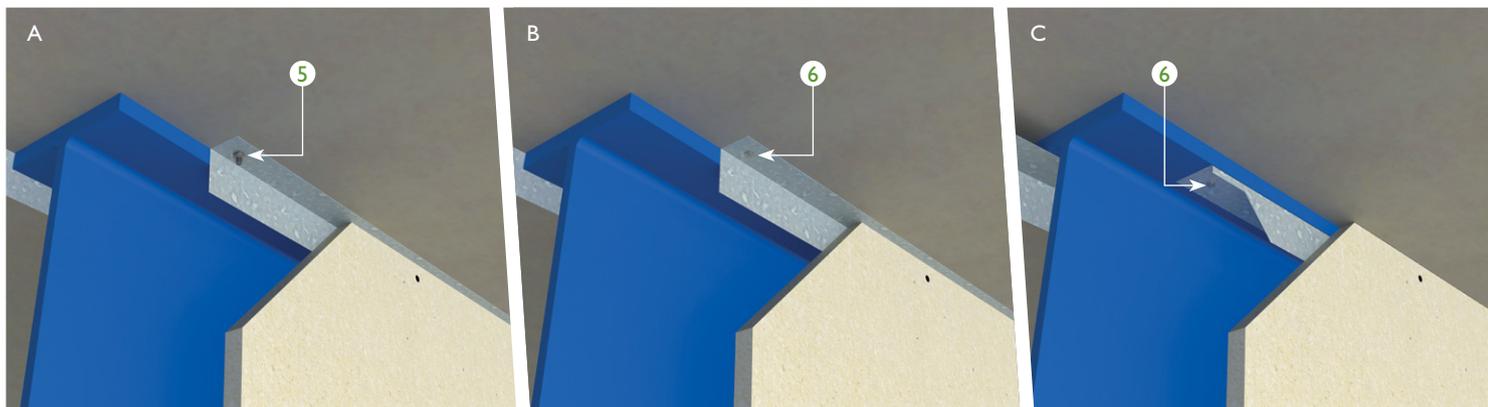

1. FP®-900/FirePro® board in single or two-layer
2. FP®-900/FirePro® backing strip 100mm wide at maximum 1220mm centres behind the board joints
3. U-channel 50mm web x 32mm flange x 0.5mm thick, or
4. Angle minimum 40mm x 40mm x 0.5mm thick fixed onto the floor or steel beam
5. M6 steel anchors at nominal 500mm centres or
6. Shot fired nails minimum \varnothing 3.7 at nominal 350mm centres.
7. Self-tapping screws minimum M3.5 x 35mm at nominal 200mm centres
8. Steel beam
9. Floor slab

FP®-900/FirePro®
Fire Protection of Structural Steel
STEEL ENCASEMENT – BEAMS & JOISTS

Alternative Fixing

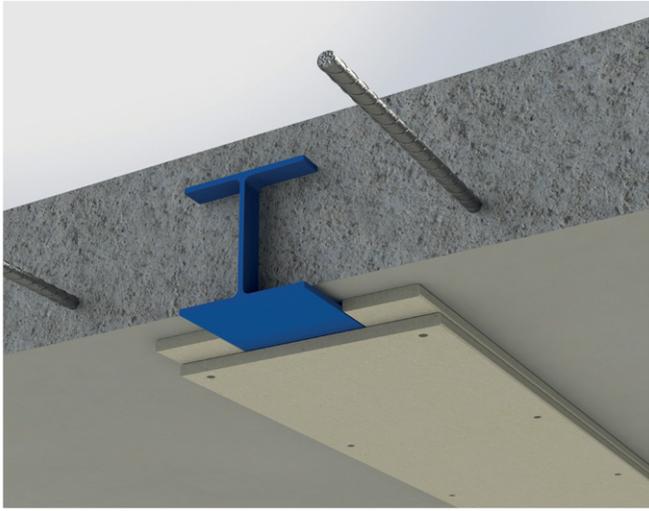

- A.** Steel angles attach to the soffit of floor by screw anchors.
- B.** Steel angles attach to the soffit of floor by shot fired nails.
- C.** Steel angles attach to the flange of beam by shot fired nails.

FP®-900/FirePro® Fire Protection of Structural Steel STEEL ENCASEMENT – BEAMS & JOISTS

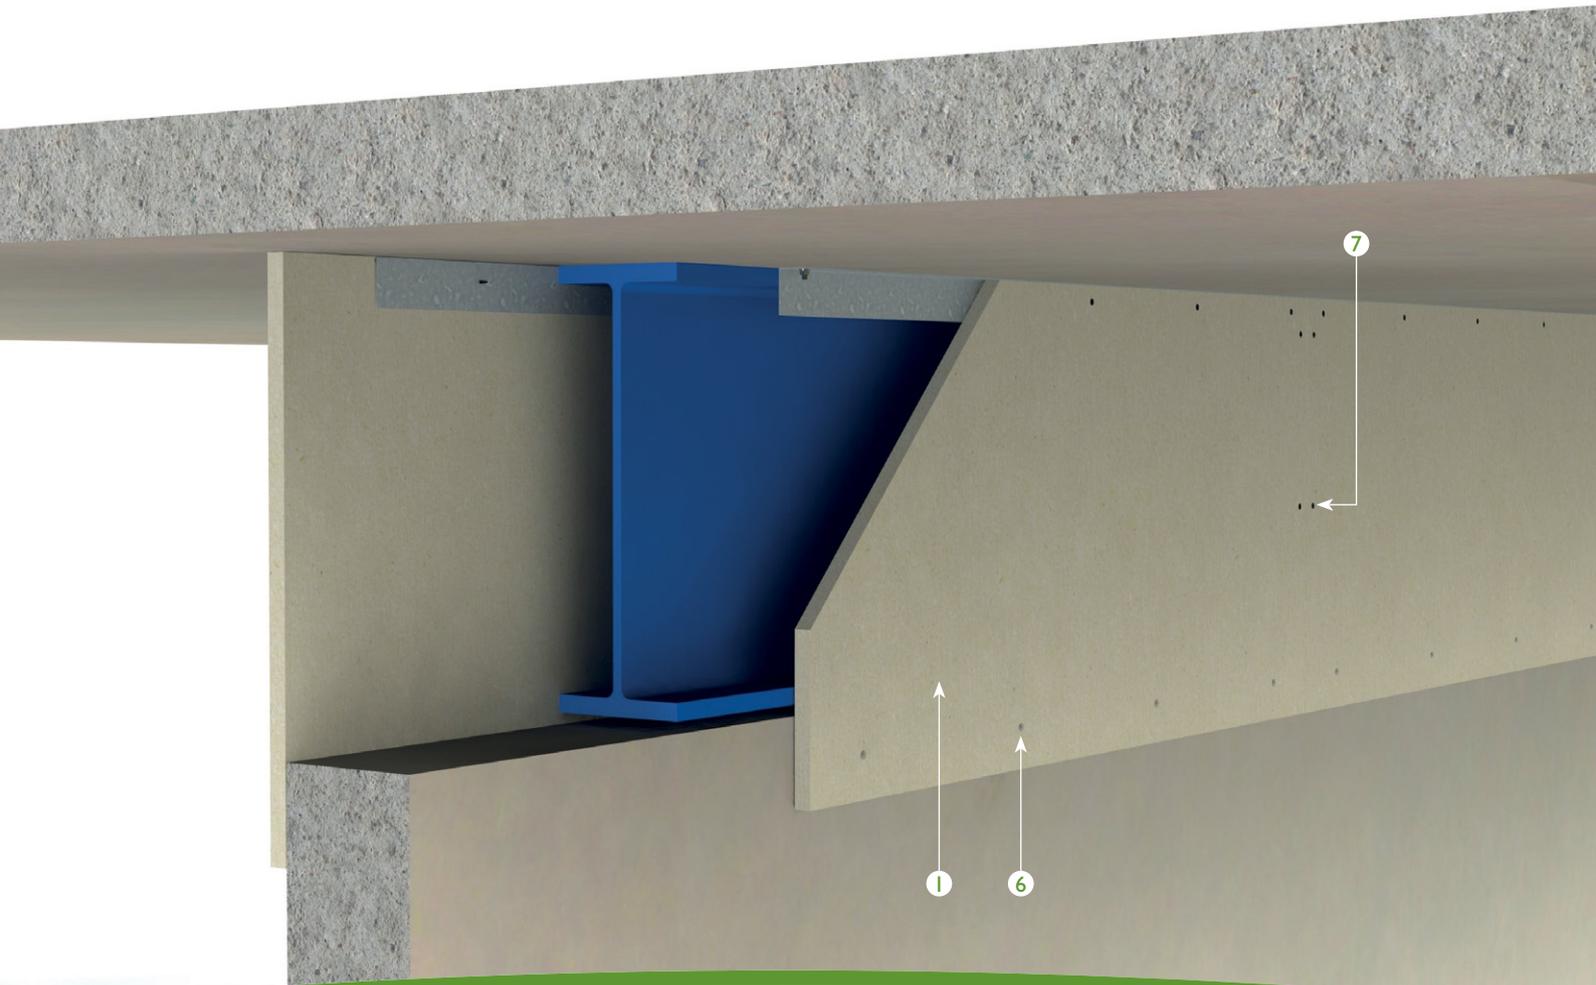

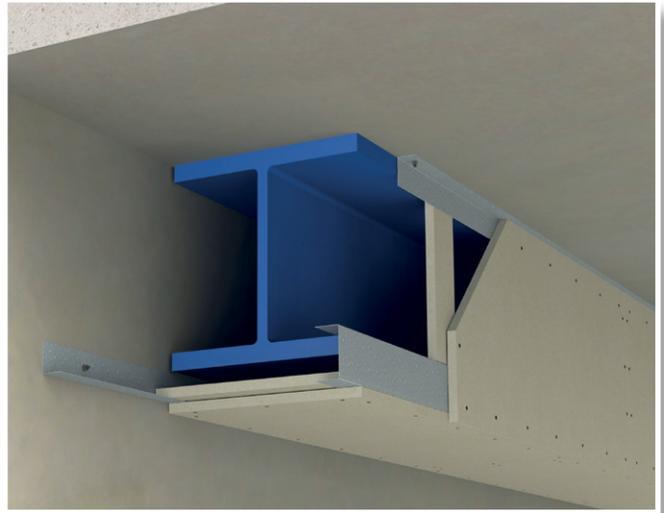

SOBEN INTERNATIONAL

ONE SIDED PROTECTION

TWO SIDED PROTECTION

DECK VOIDS ABOVE COMPOSITE AND NON-COMPOSITE BEAMS

Composite steel deck floors comprise reinforced concrete cast on top of profiled steel decking, which acts as formwork during construction and external reinforcement at the final stage. The profiled metal deck form may be either re-entrant (dovetail) or trapezoidal.

ASFP provides a guidance on fire protection of steel beams supporting profiled steel decking. With a dovetail profile, the void is small and no action is generally necessary. With trapezoidal profiles, the void is comparatively large. This creates a situation where some actions are required to balance the impact of the added heating of the top flange.

Steel Construction Institute & ASFP had conducted a research on the effect of not filling voids above composite beams and released SCI P109 technical report: The fire resistance of composite beams, Steel Construction 1991. The report provided a technical guide and recommendations for beams with unfilled voids against fire. This guidance for beams with sufficient protection to prevent temperature rises of 620 °C is reproduced in the table below.

RE-ENTRANT (DOVETAIL) PROFILED STEEL DECK

TRAPEZOIDAL PROFILED STEEL DECK

Recommendations for beams with unfilled voids[#]

Trapezoidal deck only - beam type	Fire protection on beam	Fire resistance - minutes		
		Up to 60	90	Over 90
Composite	Passive (non-reactive) and reactive	Increase thickness by 20% or assess thickness using A/V increased by 30%*	Increase thickness by 30% or assess thickness using A/V increased by 50%*	Fill voids
		*The least onerous option may be used		
Non-composite		Fill voids		

[#] See A.3.5 and Table 20 of ASFP Yellow Book - 5th Edition referenced above

Note: The above is an issue for trapezoidal, but not dovetail deck, where the void is not filled. It is necessary to make adaptations to the structural fire protection thicknesses. Nonetheless, all voids should be filled when the beam forms part of a compartment wall.

Materials used on filling the voids

The voids must be filled by the non-combustible material which should be with proven fire stopping ability.

FIRE PROTECTION OF BRACING MEMBERS

Fire protection of wind and stability bracing in a structure is generally not necessary. The fire Eurocodes give no guidance on this, however BS 5950: Part 8: Code of practice for fire resistant design recommends that the fire protection thickness should be based on the section factor of the steel bracing member, or a value of 200m^{-1} , whichever is the smaller value. The standard also states that in some cases, it might not be necessary to apply fire protection of bracing members and consideration should be given to:

1. Shielding bracing from fire by installing it in shafts or within walls.
2. The use of infill masonry walls, which can provide the sufficient shear capacity during a fire instead of relying on the steel bracing systems.
3. The possibility that only bracing systems within a fire compartment might be subjected to elevated temperatures and the other unaffected bracing system might be sufficient to provide the required stability at the fire limit state.
4. The possibility that the steel beam to column connections might have sufficient stiffness to ensure stability at the fire limit state.

Assessment of fire protection requirements for bracing[#]

Building	Degree of fire protection to bracing system
Single storey - not more than 8m to eaves	None
Single storey - more than 8m to eaves	Generally none
Two storey	Generally none, wall and frame stiffness will contribute considerably to stability
Other multi-storey	Protected to achieve required fire resistance. However the selection of thickness may be based on allowable reductions in applied loads in fire given in BS 5950: Part 8 :2003 or BS EN 1990

[#] See A.2.5 and Table 15 of ASFP Yellow Book - 5th Edition referenced above

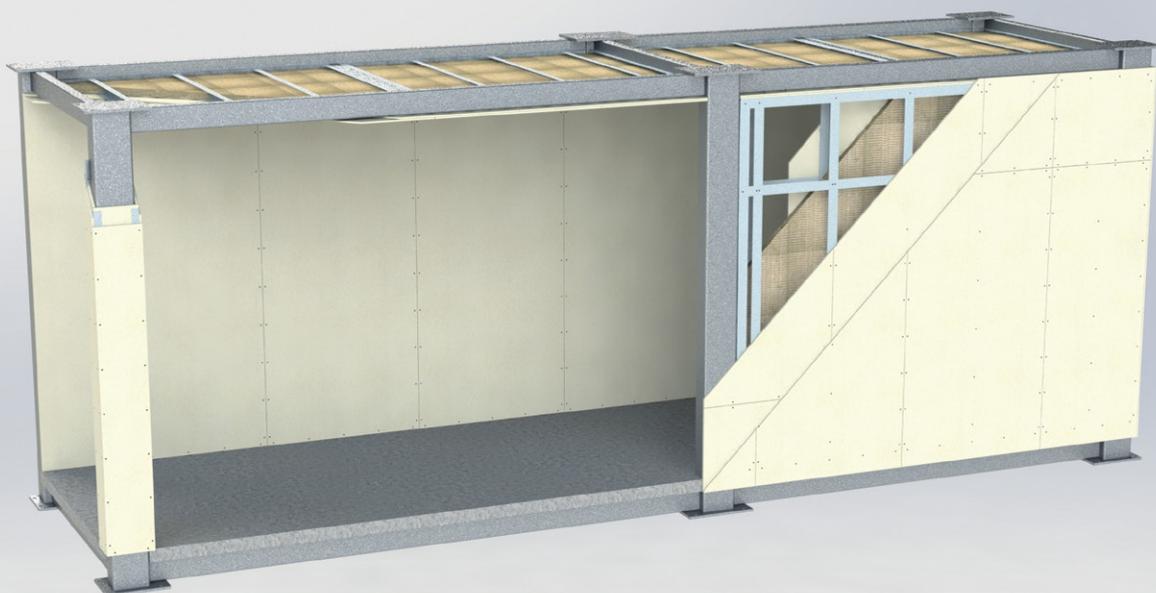

FP®-900/FirePro® Fire Protection of Structural Steel MODULAR CONSTRUCTION

FIRE PROTECTION OF MODULES BUILT WITH STEEL

Modular construction is a process in which a building is prefabricated off-site under factory controlled conditions. A building is produced in many identical modules which are assembled together on site. Steel framed modules are commonly adopted as they are light-in-weight facilitating transportation and site installation. Soben International provides fire protection solutions for modular construction with a range of FP® passive fire protection systems for steel or composite structures, fire compartment floors and walls. Being in the supply chain of modular construction over 15 years, Soben has broad experiences in assisting many clients and contractors to complete their modular construction projects. These completed projects are chained brand hotels, student accommodations and commercial buildings located in Europe, Asia and Australasia. Besides FP® fire protection solution, Soben International WeatherPro® weather resistant heavy duty fibre cement is a favourable flooring board material applied in the modules of these completed projects.

Unlike the conventional build where fire resisting constructions in a steel framed building are applied quite straightforward after the structural frame is erected on site, modular construction is more complicated. Each modular system has its unique design for off-site fabrication and on-site installation. Therefore, applying fire protection, especially at all interfaces among modules require sophisticated fire protection systems as well as fire insulation of wall and floor compartments should be considered as a whole. Further details please enquire Soben International.

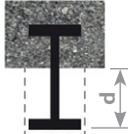

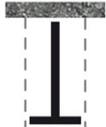

FP®-900/FirePro® fire protection of steel module up to 240 minutes fire rating |

SECTION FACTOR (A/V) OF STEEL SECTIONS

A steel section with a large surface area (A) will receive more heat than one with a smaller surface area. Also, the greater the volume (V) of the section, the greater is the heat sink. It therefore follows, that a small thick section will have a slower rate of temperature increase in a fire when compared to a large thin one. The Section factor (A/V) is thus a measure of the rate at which a section will heat up in a fire. The Section Factor of a steel section is used to determine the required protective board thickness.

Table S1

STEEL SECTION	CALCULATION OF Am FOR BOX PROTECTION				
	4 sides	3 sides	3 sides	2 sides	1 side
 Universal beams, Universal columns & Joists	$2B+2D$ 	$B+2D$ 	$B+2d$ 	$B+D$ 	B 
 Structural & Rolled tees	$2B+2D$ 	$B+2D$ 	$B+2D$ 		
 Angles	$2B+2D$ 	$B+2D$ 	$2B+D$ 		
 Channels	$2B+2D$ 	$B+2D$ 	$2B+D$ 		
 Square or Rectangular Hollow Sections	$2B+2D$ 	$B+2D$ 	$2B+D$ 		
 Circular Hollow Sections	πD 	Note. The air space created in boxing a section improves the insulation and a value of A_m/V^* , and therefore A_m , higher than profile protection would be anomalous. Hence A_m is calculated based on the circumference of the circular hollow section, not $4D$. *Section factor A_m/V per meter = H_p/A			

An example of calculation

A_m/V for a metre length of UB
 $406 \times 178 \times 85\text{kg/m}$

Four sided exposure

$$\begin{aligned}
 A_m &= 2B+2D \\
 &= (2 \times 181.9) + (2 \times 417.2) \\
 &= 1196.4\text{mm} (1.196\text{m}) \\
 A_m/V &= 1.196/0.01077 \\
 &= 110.04\text{m}^{-1}
 \end{aligned}$$

Three sided exposure

$$\begin{aligned}
 A_m &= B+2D \\
 &= (181.9) + (2 \times 417.2) \\
 &= 1016.3\text{mm} (1.0163\text{m}) \\
 A_m/V &= 1.0163/0.01077 \\
 &= 94.36\text{m}^{-1}
 \end{aligned}$$

FP®-900/FirePro®

Fire Protection of Structural Steel

PROTECTION SYSTEMS

FP®-900/FIREPRO® FIRE PROTECTIVE BOARD

FP®-900/FirePro® fire protection structural steel systems have been tested and demonstrated fire resistance of up to 240 minutes in compliance with BS 476: Part 21, EN 13381-4 and the principles of Yellow Book 5th Edition of ASFP. A full appraisal of fire protection of structural steel has been issued by Warringtonfire UK, an accredited and internationally recognized fire testing laboratory. The required protective board thickness with respect to the fire rating and steel section factor are given in the tables below.
